Callum Dunnett "Hazlett Livestock" 0274620126

FOREWORD

It is with very mixed feelings that Dianne and I have decided to disperse our Poll Dorset ewe flock, that we started breeding in 1970, 56 years ago. This 2th sale is the final part of our dispersal

A Brief History

In 1970 we purchased 9 2th ewes from George Lowes farther, TP Lowes Windermere flock.

In 1971 I won a young farmers exchange to NSW for 3 months.

While there I was very fortunate to arrange and select 4 2th ewes from either of the top two studs in Australia at the time.

I had the choice of the "Lindsbury" Stud of Gus Taylor or the "Marylebone" Stud of Bob Smith After viewing both I chose Marylebone. Of the 4 ewes one bred exceptional, one very good, and the other two OK.

So that is where it all started

Since that time we have strived to breed sheep that are tough, have a very good standard of excellence, are structurally sound, true to breed type, with good constitutions and performance for growth muscle fat and fertility, that has given them the ability to shift and thrive where ever they are used in New Zealand and around the world. In the early years of breeding, progress was often frustratingly slow. When we started in 1970 it was only 12 years from the initial polling of the Dorset Horn in Australia, so there were often very good sires that we couldn't or wouldn't use because they still had small horns (scurrs). Likewise later when we were trying to improve the foot scores of our flock, there were very good sires who didn't have acceptable foot scores.

Over the course of our 55 years of breeding we made additions by purchasing ewes in small numbers, often 1 or 2 but there were 3 bigger purchases, from Walter Sommerville "Somerset Stud" from Alf Phillips "Benhope Stud" and from Selwyn Adams "Colinton Stud". The Colinton ewes and the Coastlands ram 40/10 from Cliff Derry were a great help with our foot score breeding programme.

We have continued to use DNA testing to identify sires with good foot scores. After initially identifying some ewes with 1-1 foot scores, and using them for embryo transfer we got a nucleus of 1-1 ewes. After a lot of selection we have been able to keep sires with very good foot scores.

When we have be able, we have tested our keeper sires for Intramuscular fat (IMF) and those results are shown with the Reference Sires, as well as a page showing images as to how animals are graded. The ewe flock is fully recorded with SIL and the rams are muscle scanned by Peter Clulee of Otago Ultra Sound. All the ewes carry 10 in 1 vaccine and are Toxo and Campy vaccinated. The two tooth ewes have been given a toxo and 2 Campy vaccinations.

Over all those years the flock has never let us down with their lambing percentage, pretty much always between 170 and 180 % scanning, sometimes more, regardless of seasonal influence.

Although in recent years we have only shown at our local show, for many years our sheep held their own in the show ring in this country and their progeny have around the world. Four sons of Adelong 465/01 (Crusader) won Lamb Plan performance classes at the Melbourne, Adelaide, Perth and Sydney Royal shows as well as other rams and ewes excelling at shows in the UK and South America. In 2004 Adelong 465/01 (Crusader) beat all Rams from All Breeds in a terminal sire evaluation of 1.2 million sheep in a programme called Advanced Central Evaluation.

The flock has had an influence on the Breed around the world, with exports having been made to Australia, England, Ireland, Canada, Japan, Korea, Brazil, Argentina, Patagonia, Uruguay, Mexico, Chile and China.

Dianne and I have been very fortunate and greatly appreciate the people who have been involved with us and the Stud over all those years, since Dianne's father Arnold Partridge was involved in the selection of the initial 9 ewes.

Thank you to you all we will always be grateful and appreciative of the life time of help and associations. In the middle of the Catalogue are some of the photographs of the people who have been closely involved.

To all our loyal clients, and the Poll Dorset breeders we have been associated with from the very start. Thank you for the support you have given us, the friendships and comradery are life time gifts we will never forget.

It has been a great journey. THANK YOU

The ewes presented are in genuine sound condition, and we wish purchasers all the very best with their future breeding programmes.

Neville and Dianne

Acknowledgements

My first and most important thanks must go to Dianne, who has been involved from the very start, has done all the recording meticulously, this year with 780 lambs and only one double up on the lambing records.

Dianne is one of the best judges of sheep I have seen, and with all the work of putting our sales together over the years, I simply could never have done it without her at my side.

To Callum Dunnett of Hazlett, for all his help in selecting and cataloguing all the ewes for sale, as well as the planning, ideas and advice. Thank you so much.

To all outside companies thank you for your support, very much appreciated.

Our sincere thanks to Chris Logan of Flock-Linc (SIL Bureau) for his work in loading all the pedigree and performance data and preparing the catalogue for print. Chris has been an integral part of our breeding programme and our on farm and export sales. His accurate data recording and help over the years is very much appreciated.

To our Granddaughter Zoe, who has been involved with us in our farming business as well as her own small flock for 4 plus years. Thank you.

Once again we have been very fortunate to have had a lot of help preparing the sale and its facilities. To you all Thank you.

As in the past Dianne and I thank you for your support over many years, and we look forward to catching up with you at this sale.

Neville and Dianne

Cape Campbell Farm Ltd.

4 February 2025

Dear Neville,

Just a few words from Rob:

We bought our first Adelong Ram in 1983 for \$8000 as our foundation sire. Since then, although trying other rams, we have always gone back to Adelong rams. The main reasons have been: soundness, balance and performance.

On our Cape Campbell, east Marlborough property, we run a stabilised Corriedale/Poll Dorset/Texel composite flock. This year the single lambs killed 22.8kg at 95 days and the twins went 20.5kg at 105 days with very few store lambs left. All the ewes and lambs are run on dry medium hill country and much of this performance is based on Adelong genetics. The strength and milking ability of the ewes is outstanding.

In our stud Poll Dorset flock we have increased the average measured muscling by 50% using Adelong rams.

We highly recommend Adelong genetics to any potential buyers at the upcoming stud sales.

Thankyou Neville and Dianne

Rob and Sally Peter.

Explanation of IMF (Intra muscular Fat)

The fat line at the top of each picture is subterraneous fat which is the same as what we measure when we do Eye Muscle area. The rounded tops at the bottom are rib tops and lumbar. Because this is a longitude picture, this is the length of the loin strap. So we are looking for colour in between subterraneous fat and rib tops. You can see from the difference between picture 1 and picture 3 a lot more colour in picture 3 and therefore a lot more IMF.

Grade 1 = Virtually no IMF

Grade 2 = IMF Showing but to a lesser degree than a 3

Grade 3 = Very High IMF

Grade 1

Grade 2

TERMS AND CONDITIONS

The New Zealand Stock & Station Agent's Association Conditions of Sale and, to the extent deemed relevant by HAZLETT Limited, HAZLETT Terms of Sale apply to this sale. When proceeds are credited or a purchase is debited to a HAZLETT monthly credit account, then HAZLETT'S Monthly Account Terms of Trade (as amended from time to time) apply to the extent deemed relevant by HAZLETT. These terms can be inspected at the registration desk and on the wall in the auction room. The current versions of HAZLETT'S Terms of Sale and Monthly Account Terms of Trade are also available online at:

www.hazlett.nz

All intending purchasers must register at the sales office prior to the sale.

HAZLETT will pay a purchasing rebate of 5% of the purchase price excluding GST, plus GST, to livestock companies & recognised independent livestock agents with a HAZLETT account who have introduced buyers to HAZLETT before the sale and/or accompanied buyers to the sale.

EXPLAINING SIL AND SHEEP SELECTION TOOLS

The SIL NZ Standard Terminal Worth Index (NZTW) focuses on key economic factors that influence farm income and costs – growth, survival and meat (carcass quality). SIL NZTW expresses (in cents per ewe lambing) differences in overall genetic merit between rams which are used in a prime lamb production system in which all progeny are slaughtered.

For example, if rams A and B from the same flock, with NZTWs of 600 and 700 respectively are mated to genetically similar ewes, ram B would be expected to produce progeny that on average return 50 cents ($700 - 600 / 2 = 50$) more than ram A per ewe mated. Assuming the two rams were mated to 300 ewes during their lifetime Ram B would be expected to generate \$150 (300×50 cents) more profit than Ram A.

A combination of sub-indexes TSG (Terminal Sire Lamb Growth) TSM (Terminal Sire Meat yield) TSS (Terminal Sire Survival), which when combined together add up to the NZTW.

Breeding values (BV's) are an estimate of genetic merit for a single trait. They are measured in the units of the trait, e.g. weaning weight BV is measured in kgs. Number of lambs born BV is a measure of proportion of lambs born (proportion $\times 100 = \%$). Breeding values are calculated using information from the individual animal and its relatives, the deviation from the group average and the heritability of the particular trait.

Information in relation to the SIL performance data presented in this catalogue

The genetic analysis was run as a New Zealand Single Step Genetic Evaluation Version 6 incorporating 1447 flocks.

Using this analysis, the following SIL traits are presented: NZTW, TSS, TSG, TSM

The data presented in this catalogue was provided with the assistance of FLOCK-LINC an approved SIL bureau.

FOOTROT GENE MARKER TEST

Blood samples collected from sheep can be “typed” to reveal which alleles of the DQA2 gene the sheep has. Sheep have two alleles, reflecting that they inherit one allele from each parent and thus can pass each allele on to their progeny in approximately a 50 : 50 ratio. The “flow” of alleles can thus be followed through extended pedigrees of sheep.

Rather than reveal the exact alleles sheep possess, the alleles have been codified into a ‘1’ (least likely to get footrot) to ‘5’ (most likely to get footrot) scale. The individual alleles are placed on this scale based on the “relative risk” of getting footrot. In our research, sheep with a ‘1’ or ‘2’ score are considered less likely to get footrot than average and sheep with a ‘4’ or ‘5’ score are considered more likely to get footrot than average. Sheep with a ‘3’ score are average (i.e. considered more likely to get footrot than those with a ‘1’ or ‘2’ and less likely to get footrot than those with a ‘4’ or a ‘5’ score).

The graph below shows how the footrot ratings correspond to the relative risk scale, with sheep scoring less than ‘3’ being considered fractionally less likely to get footrot, while those greater than ‘3’ are a number of times more likely to get footrot.

LEAST SUSCEPTIBLE

MOST SUSCEPTIBLE

It is recommended that if reducing footrot incidence is a breeding objective, then culling or corrective mating those animals with scores of 4 or 5 is desirable.

Cold Tolerance Gene-Marker Test

Score A represents an average or above average chance of lambs surviving cold-related causes of mortality; score B represents an average or above average risk of lambs dying from cold-related causes, and score C represents a markedly increased risk of lambs dying from cold-related causes. Lamb survival is one of the key performance indicators for farm productivity; this gene test should be used in conjunction with traits such as ease of lambing, ewe temperament and mothering ability to reduce lamb deaths.

Sheep get two scores for each gene test, reflecting the fact that chromosomes are paired and hence they typically have two copies of any gene. The inheritance of any form of gene (called an allele) can accordingly be followed through pedigrees. Sheep with two copies of the same allele pass one copy of it on to all their progeny, while sheep with one copy (and any other allele) pass this on to 50% of their progeny on average (the other allele is passed to the other 50% of progeny). Gene test results should always be used in conjunction with each stud masters own breeding objectives and not as a replacement for sound animal breeding.

This sale will be held as a HYBRID ON-FARM auction on bidr® (bidr.co.nz), with online bidding and a live-stream for online buyers. All online purchasers must register with bidr® through an account with a bidr® partner agency before sale day.
